# OpenAI Dots - One Page Documentation

**Date:** 30 September 2026
**Category:** AI Agents & Automation

**Overview**
OpenAI Dots are proactive AI agents designed to work independently on assigned goals over extended periods. Unlike traditional chatbots, they can continue working, use tools, access connected applications, and provide updates when meaningful progress is made.

**How Dots Work**
1. User assigns a goal or task.
2. Instructions and permissions are provided.
3. The Dot works autonomously using available tools and connected services.
4. It returns results, requests approval when needed, or provides progress updates.
5. Users maintain control through permissions and review processes.

**Key Capabilities**
- Research & Analysis
- Software Development
- Productivity Support
- Application Integration
- Long-Running Tasks

**Benefits**
Automates complex workflows, reduces manual effort, improves productivity, and enables project delegation while maintaining human oversight.

**Security & Governance**
Operates within user-defined permissions, supports monitoring and approval mechanisms, and helps protect data and system integrity.

**Potential Use Cases**
Customer feedback analysis, automated research, report generation, recurring business processes, and software development support.

**Conclusion**
OpenAI Dots represent a shift from conversational AI to autonomous AI agents capable of executing multi-step work while keeping humans involved for review and decision-making.
